

SafeGuard LM 6.x Evaluation Version

Welcome to SafeGuard LM 6. SafeGuard LM is comprehensive software license management for small to large businesses. Whether you are a small developer working with C/C++, Java, Python, Objective C, PHP 7, FORTRAN, MetaTrader 5, Perl, AutoHotKey or VB.NET applications, or a business that has thousands of users, we provide the optimal solution to protect your software.

The SafeGuard LM Evaluation Version is fully functional. It is licensed for a 30-day period with the following limitations:

- Node-locked licenses are restricted to the “any” host ID. This means licenses you generate are good to run on any computer.
- Floating licenses are limited to one client connection at a time. You may generate any number of licenses, but only one client can connect to the server at the same time.
- The reverse proxy server that forwards requests to the Product Activation Server or license server from the Internet only allows one connection.
- The software is licensed for a 30-day trial.
- The Product Activation Server is limited to one thread.
- You will not be able to generate a private encryption seed.
